Phase 3 Rubric

Preliminary Data Analysis + Feasibility Analysis

Point Breakdown

Criterion	Points	What strong work looks like	Common reasons for deduction
Dataset plan	6	Source is credible and appropriate; access method is clear; expected size and labels are stated; scope is realistic.	Missing label details, vague access plan, unrealistic size claims, or weak dataset-to-problem alignment.
Preliminary EDA	4	Shows useful plots/tables, class balance, sample inspection, and visible discussion of missingness, noise, or quality issues.	Only descriptive text, little evidence of inspection, or no discussion of quality problems.
Preprocessing plan	4	Clearly states cleaning, filtering, segmentation, normalization, or augmentation steps that follow from the data issues found.	Generic preprocessing list not tied to the dataset or EDA findings.
Model plan	7	Includes a sensible baseline and proposed deep model(s), with a brief rationale for each.	No clear baseline, model list is too vague, or models are too ambitious for the data/time available.
Evaluation plan	6	Names metrics and validation strategy clearly, including split design, imbalance handling, and leakage awareness.	Metrics are incomplete, validation is underspecified, or leakage risk is not addressed.
Feasibility risks + mitigation	8	Identifies realistic project risks and pairs them with concrete mitigation steps.	Risks are generic, missing, or mitigation is not actionable.

Total: 35 points

Performance Bands

Range	Interpretation	Typical characteristics
32–35	**Excellent**	Clear, evidence-based EDA; realistic dataset and preprocessing plans; well-defined baseline and deep model plan; evaluation and feasibility are both strong.
28–31	**Good**	All required parts are present, but one or two sections are broad, lightly evidenced, or not fully connected to the dataset.
22–27	**Developing**	Core requirements appear, but EDA is shallow, model/evaluation plans are vague, or feasibility discussion is limited.
0–21	**Needs major revision**	Missing major rubric components or lacks enough evidence to judge feasibility.
